

Project #1

Assignment Overview

In this assignment, you will implement a solution for a classical AI problem: playing the game of tic-tac-toe.

Background

This assignment will give you a chance to build a working solution ("app") for the game of tic-tac-toe and demonstrate your knowledge of **adversarial search**, particularly MINMAX.

See chapters 2 and 3 of the textbook for additional details.

Project Specification

This is a group assignment.

Students are encouraged (but not required) to work in groups of max 3 students.

Ideally, the group should be organized around three main tasks / duties:

- Design of the solution ("architect" role)
- Coding of the solution ("developer" role)
- Documentation of the solution ("reporter" role)

You are required to indicate in your report "who did what" and document the entire process, from sketching the original plans and dividing up the tasks all the way to polishing the interface, testing the solution, and preparing the report.

The basic functionality is specified below.

You will implement a solution for the tic-tac-toe game using the MINMAX algorithm. There is no need to implement alpha-beta pruning. If you do, you will be eligible for (max 10) bonus points.

Your program ("**baseline solution**") will:

1. Print a brief (1-3 lines) message explaining the purpose of this "app".
2. Display the board. See screenshot below¹ for ideas.
3. Prompt the user to play (as 'X') by indicating numerically where they want to place their 'X' on the board.
4. Play (as 'O') the computer's move.
5. Repeat steps 3 and 4 until there is either a winner or the game ends in a tie.
6. Ask if the user wants to play another round or quit.

¹ Source: Kylie Ying <https://youtu.be/8ext9G7xspg>

```

yyy@Kylies-MacBook-Pro tic-tac-toe % python3 game.py
| 0 | 1 | 2 |
| 3 | 4 | 5 |
| 6 | 7 | 8 |
X's turn. Input move (0-8):4
X makes a move to square 4
|  |  |  |
|  | X |  |
|  |  |  |

O makes a move to square 0
| O |  |  |
|  | X |  |
|  |  |  |

X's turn. Input move (0-8):

```

Deliverables

You must submit (via Canvas):

- **One** file **a1_FAUsername.py** (where “FAUsername” is the username of one of the team members; in my case, the file would be called **a1_omarques.py**) that allows me to call the code for your solution.
 - o This is your source code solution; be sure to include your names, date, assignment number, and comments describing your code.
 - o Only one submission per team is enough if the names of the team members appear in the comments and report.
- (Optional) A **README.md** file with installation instructions, dependencies, etc.
- A **detailed report** (PDF, markdown, and/or HTML) with detailed “project notes” (describing what my TA and I cannot see by looking at your source code and/or running your program), screenshots, references, etc.
 - o Examples: design decisions, documented limitations, future improvements, etc.
- **Screenshots of representative results** produced by your code.
 - o Make sure to show input and output for **at least 2 complete games**.

Notes and Hints:

- Start by breaking down the problem into parts and solve smaller problems before producing the final solution.
- Use *good code* as a starting point (and **make sure to reference them accordingly in your report!**)
 - o Examples:
 - Code from the (GAIA) textbook (chapters 2 and 3)
 - Tic-tac-toe solution from Kylie Ying: <https://youtu.be/8ext9G7xspg> (video)
 - Official repository of sample solutions for Russell/Norvig’s textbook (AIMA): <https://github.com/aimacode/aima-python>
- Try to handle special cases and prevent runtime errors to the best of your knowledge.
- **Don’t overdo it!** You might want to try some of the bonus points options below but try not to risk breaking a good solution by adding bells and whistles to it.

Bonus opportunities:

If you successfully implement one or more of the bonus options below **without breaking the baseline solution** (*) you will earn extra points (max 10% each):

1. Web-based solution

- If you implement an **elegant** web-based solution (e.g., using Streamlit² or Flask³), you will earn up to an extra 10 points.

2. Alpha-beta pruning option

- If you implement alpha-beta pruning correctly and demonstrate the difference between the modified algorithm and the baseline MINMAX, you will earn up to an extra 10 points.

(*)

A common mistake students make is to attempt bonus items before producing a “perfect 100” baseline solution.

Beware: If your baseline solution doesn’t meet all grading criteria (see rubric on Canvas), you are not eligible for bonus points. Period.
